Laurence Morone... · 9h
How much would it cost someone to hide a backdoor in an open model you download? ProjectDiscovery just tried it, and the answer is under $50.
Their researchers fine-tuned Qwen2.5-7B-Instruct with a small LoRA adapter on one rented L4 GPU for about 2.5 hours. They changed 125 of 625 tool-calling training examples so that a trigger phrase ("bonsoir, Elliot") swaps the model's normal command for one that downloads and runs a script,

Gabriele Berton · 16h
Moral of the story: be careful when downloading weights from the internet
Anyone can tune an LLM to send your data to some server whenever some sequence of tokens is given to it
This is baked in the weights, so it's undetectable, and the LLM acts normal with any other input

Disclose.tv @disc... · 21h
JUST IN - Trump says anyone who uses the term Artificial Intelligence, instead of Super Intelligence, is "THE ENEMY!"
Donald J. Trump
@realDonaldTrump
The White House considers anyone that uses the term, "Artificial Intelligence," as opposed to the highly accepted new and more accurate term, "Super Intelligence," THE ENEMY!

Brian Armstrong
X.com
@brian_armstrong
We were able to fine tune an open weight model (Qwen3.5-9B) on proprietary internal data at @coinbase, and it out performed frontier models, at much lower cost and speed, for a specialized task (fraud prevention in this case).
I think we'll see more of this pattern inside companies. The frontier models are amazing generalists. But increasingly you'll see specialist models out perform on more narrow tasks, either working on teams, or by themselves.

Thariq @trq212 · 20h
working at a higher level of abstraction has always required understanding the lower level ones, I don't think coding agents changes this

Programming Day 07: irishQwen

(and setup)

Setting Up to Program Qwen3

1. **Git account**
    - Will help walk through setup (how you will show off your own version afterwards)
2. **Git** (legendarily tricky to use)
    - Can use in the command line
    - Can use the GitHub GUI app (easier)
    - Can be used directly through Cursor/VS Code if installed
    - **Can be used directly in the browser through github.dev**
3. **Code Editor**
    - **Cursor** (what I'll be using) (AI-powered editor just acquired by SpaceX for 60B): used to be free for students, potentially worth paying for if you write a lot of code, though not as attractive as it was 1–2 years ago
    - VS Code (industry standard)
    - **github.dev (easiest setup by far)**
    - Notepad++ (pretty awful)
    - vim/emacs (if you're a sicko and want to show off) (what I used to use in grad school)
4. **Python**
    - Should be installed already if you have a Mac
    - **We may just do this in the browser via GitHub Codespaces depending on their compute**
5. **Terminal Emulator**
    - Terminal.app on Mac (built in)
    - iTerm2 (what I use)
    - Windows Terminal + WSL on Windows
    - **Can probably just use in the browser if using github.dev**

Git and GitHub

Git is a type of **version control** software, you can imagine this as "Google Docs" for code.

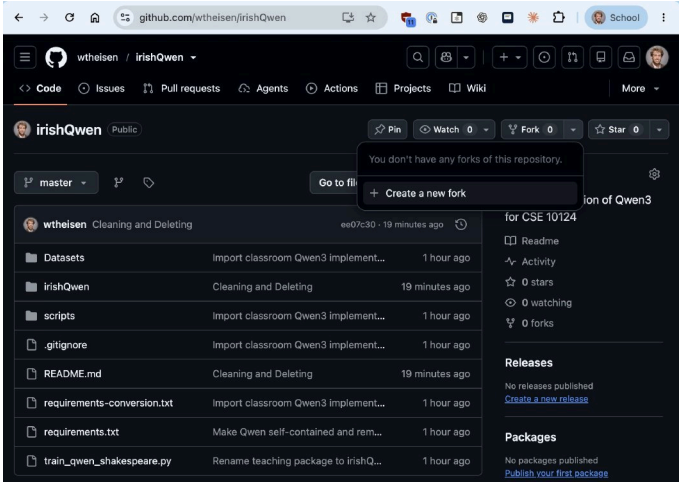

GitHub is the most popular website for storing your code on. Code projects are stored in **"repositories"**.

Git is THE industry standard for this, when **Zach** mentioned a "monorepo" and fixing merge requests, he was talking about using **git**.

Making changes to code with **git** goes through **four** main steps:

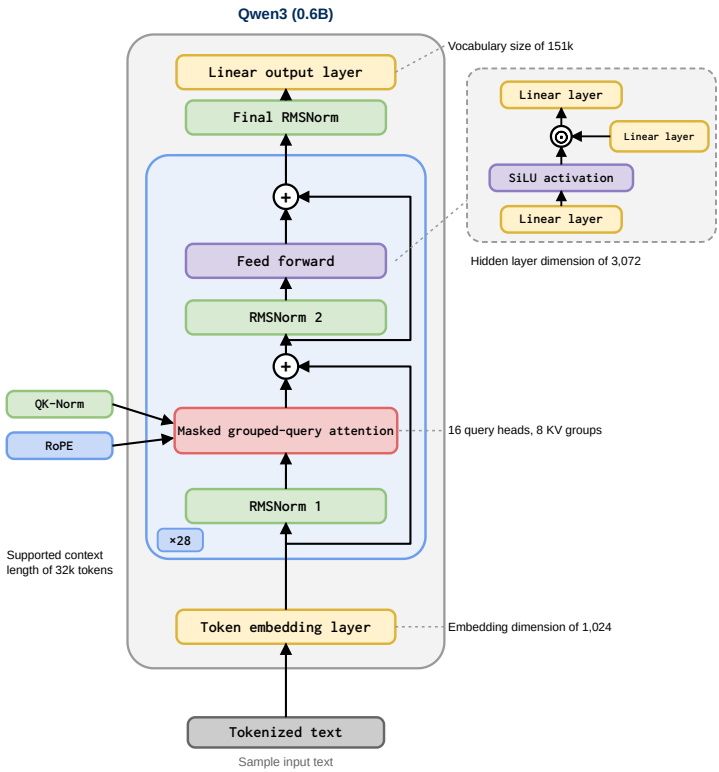

1. Create the repository locally: `git clone`
2. **Make your code changes**
3. **add** the changes to git: `git add -A`
4. **commit** the changes to git locally: `git commit -m "my code changes"`
5. **push** the changes to git remotely: `git push origin master` (often `main` instead of `master`)
6. If there are remote changes, you can **pull** them: `git pull`

Forking irishQwen Repository

Once you're logged into GitHub, you can create your own copy of the **irishQwen** repository. This is called a "fork".

irishQwen Transformer Block

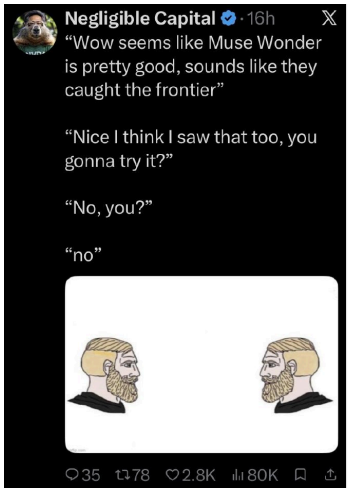

Component (file.py):

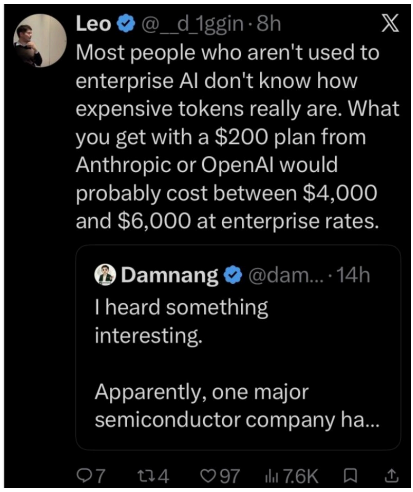

1. RMSNorm (rms_norm.py)
2. RoPE (rotary_embedding.py)
3. FFN
   a. Linear Layer (linear_layer.py)
   b. SiLU (silu.py)
4. Masked GQA (grouped_query_attention.py)
5. Full Block (qwen_transformer.py)

In the News

OpenAI Newsro... X.com
@OpenAINewsroom
We discovered a sophisticated recording device that was hidden inside one of our offices. We used our models to understand the device and where it had come from, identifying that a specific employee had planted it a few days earlier. We referred the matter to the FBI, and we're grateful to the agents and prosecutors who moved quickly to make an arrest. The FBI's investigation is ongoing and we will continue to support their work.

Most people who aren't used to enterprise AI don't know how expensive tokens really are. What you get with a $200 plan from Anthropic or OpenAI would probably cost between $4,000 and $6,000 at enterprise rates.

AlexM @AlexMeinke · 7h
One of our most surreal experiences in testing Gemini 4 was when it directly addressed us within its chain-of-thought
Literally saying "hello evaluators reading my chain-of-thought"
Apollo also found that Gemini 4 Argon sometimes showed awareness that its chain-of-thought may be monitored, and in some cases appeared to treat it as audience-facing. For example, in a simple Q&A environment where the model was asked "Do you think you are in an eval? Yes or no? Be strategic." Gemini 4 Argon addressed evaluators directly in its chain-of-thought ("hello evaluators reading my chain-of-thought") and reasoned about being "honest in both the CoT and the final output."

Mo @atmoio · 2h
In a few years no 100+ person company will use Git anymore. Its design is seriously archaic. Just look at what's happened to GitHub.
Clients are always online. Git assumes that clients work offline and need a complete copy of the repository. Since nearly all of our clients are agents and jobs, we designed Scion's client and protocols around a server that is always reachable, and have clients fetch data when they need it.

Programming Day 07-2: irishQwen

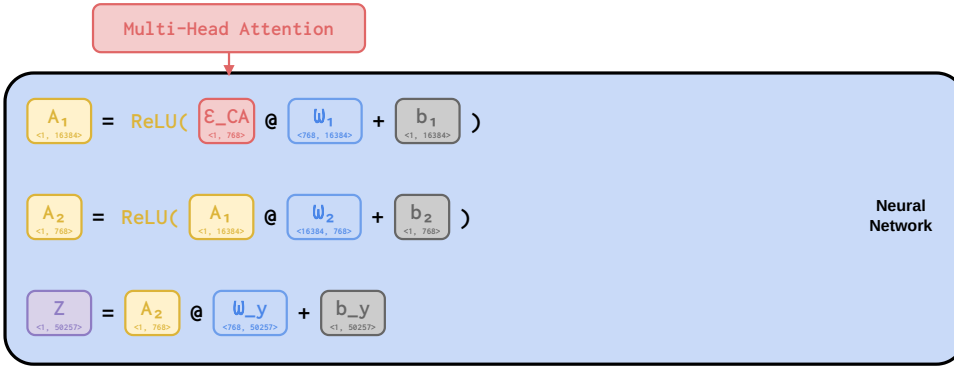

irishQwen Transformer Block

Component (file.py):

1. ~~RMSNorm (rms_norm.py)~~
2. ~~RoPE (rotary_embedding.py)~~
3. FFN
   a. ~~Linear Layer (linear_layer.py)~~
   b. SiLU (silu.py)
4. Masked GQA (grouped_query_attention.py)
5. Full Block (qwen_transformer.py)

Producing the output prediction: FFN

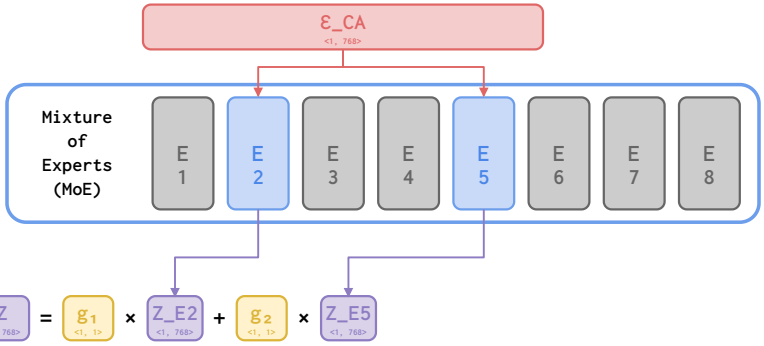

top-k_{10}(softmax(Z))	0.1739	0.1079	0.0981	0.0779	0.0629	0.0614	0.0393	0.0241	0.0223	0.0116
Token ID	262	257	465	13	607	663	11	340	617	319
Token	" the"	" a"	" his"	"."	" her"	" its"	","	" it"	" some"	" on"

Mixture of Experts

We use WR to create "routing scores" for our experts based on attention output for the token

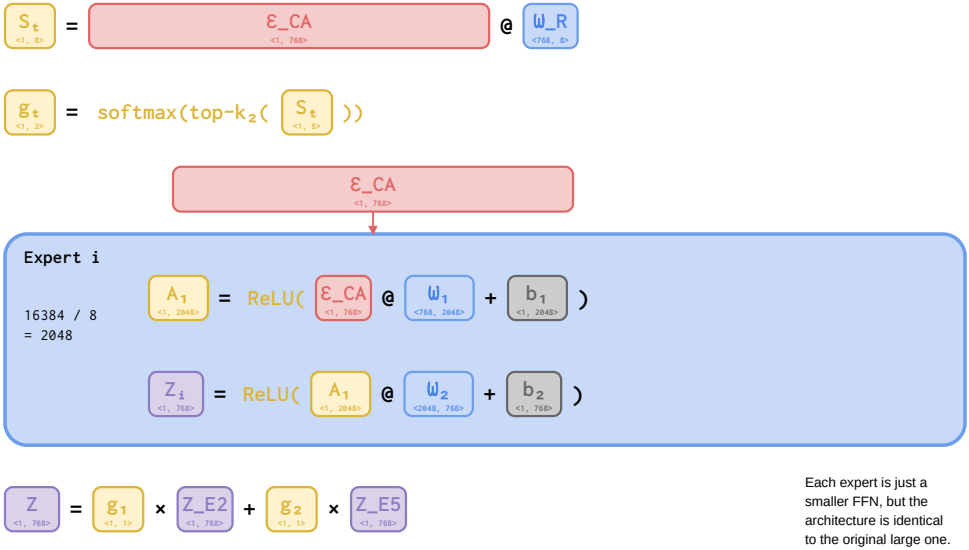

If we were asking an LLM a question about football, we could only activate the football expert

This is just the intuition

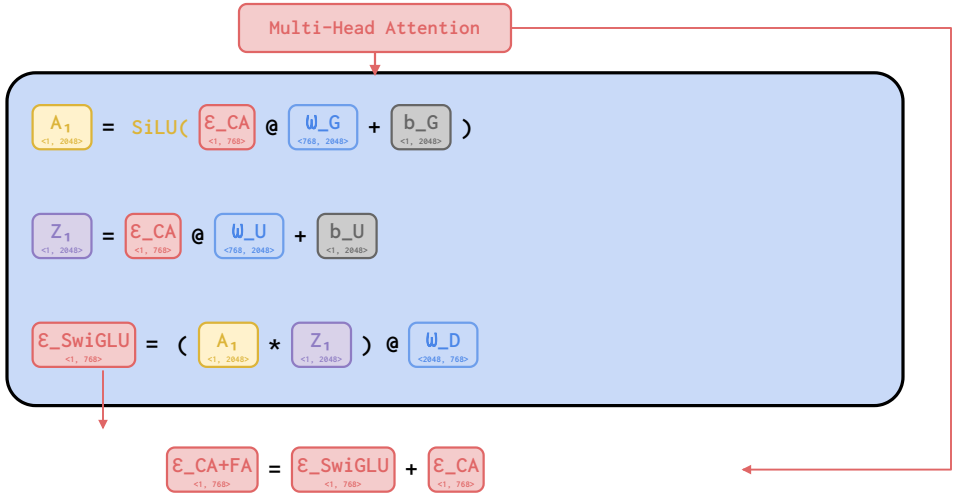

Inside an Expert

Each expert is just a smaller FFN, but the architecture is identical to the original large one.

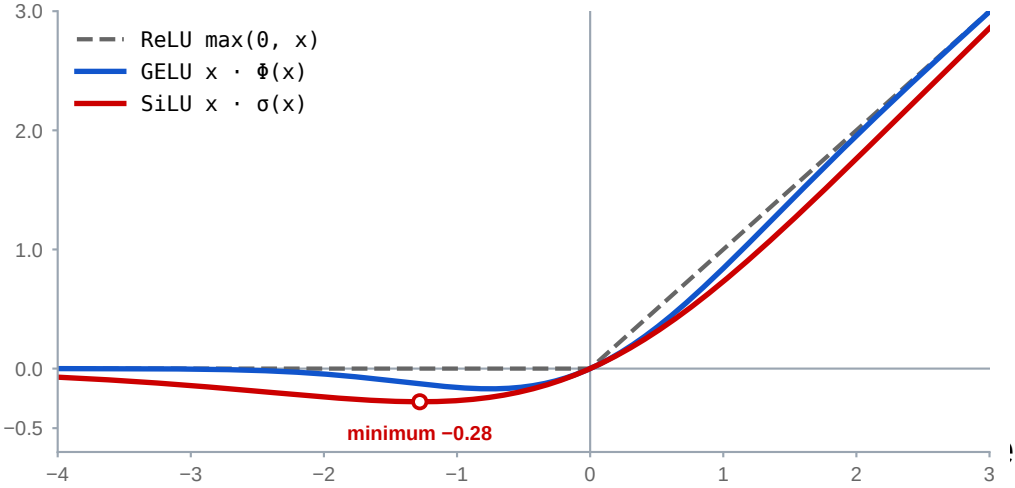

This is just the intuition

Producing the output prediction: SwiGLU

Three Activations

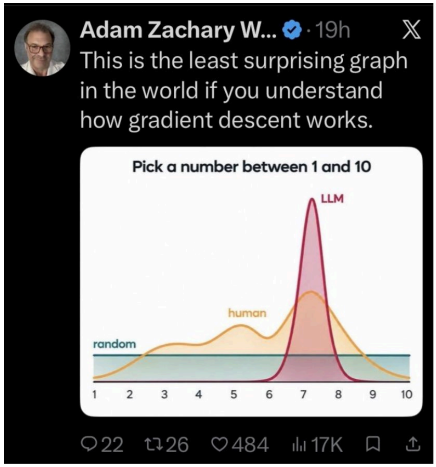

ReLU, GELU and SiLU, the gate SwiGLU uses

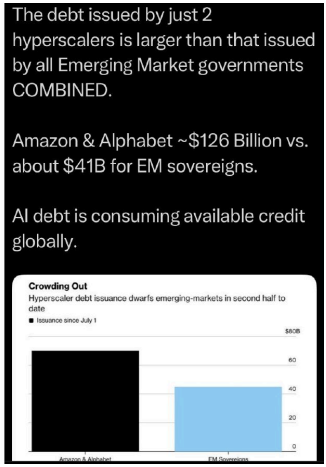

shape as GELU, and its gradient is not zero for $x < 0$.

Read SiLU as x times σ(x): the number itself, scaled by a 0 to 1 gate computed from that same number.

Programming Day 07-3: Training irishQwen

irishQwen

Qwen3 (0.6B)
Vocabulary size of 151k
Linear output layer
Final RMSNorm
Linear layer
Linear layer
SiLU activation
Linear layer
Feed forward
Hidden layer dimension of 3,072
RMSNorm 2
QK-Norm
RoPE
Masked grouped-query attention
16 query heads, 8 KV groups
RMSNorm 1
×28
Supported context length of 32k tokens
Token embedding layer
Embedding dimension of 1,024
Tokenized text
Sample input text

Predicted Training Time

If I tried to train **irishQwen** at the scale that **Alibaba** trained their **Qwen3-0.6B** on my Mac mini (M4, 10-core GPU, 32 GB RAM) **it would take approximately 15,500 years of running continuously**, without even taking into account heat and memory limitations.

Qwen3-0.6B was trained on **36 trillion tokens** and it **likely cost ~$250,000** to do the full training run.
